

Q1: What problem does Salesforce solve?

Salesforce solves customer relationship management problems by storing customer data in one place.

It helps teams like Sales, Marketing, and Service work together using shared data.

Salesforce improves sales tracking, team collaboration, and automation.

It replaces spreadsheets and manual data management with a cloud-based system.

Q2: What is CRM?

CRM stands for Customer Relationship Management.

It is used to manage customer interactions and improve relationships with customers.

Salesforce provides a cloud-based CRM platform for businesses.

Customer 360 gives a single shared view of customer data across teams.

Q3: What is an Object in Salesforce? Give one example.

An Object in Salesforce is used to store data about customers or businesses.

It represents real-world entities digitally.

Objects help organize and manage information in Salesforce.

Examples: Accounts, Contacts, Leads, and Opportunities.

Q4: Difference between Salesforce Admin and Developer

A Salesforce Admin manages and configures Salesforce for users with little coding.

A Salesforce Developer builds custom applications and solutions using programming.

Admins handle users, reports, and security settings.

Developers work with coding, APIs, integrations, and automation tools.

Q5: Suggest one real-world application that can be built using Salesforce.

A College Management System can be built using Salesforce.

It can store student, faculty, and department data using Salesforce objects.

The system can track admissions, enrollments, and attendance.

It also improves communication and data management in colleges.
